Forecast for Friday 01 Jan 2021

Weather: Outbreaks of rain, sleet and snow will continue overnight but clearing by dawn although there will be a lot of low cloud to start the day. Cloud will gradually lift and break in the morning to leave a dry day with a few bright or sunny intervals developing. Cloud continuing to break leaving a mainly clear evening with a frost developing.

Chance of cloud free mountain/hill tops above 800m: In the morning 60% with scattered cloud around 600m shrouding the tops at times. Most cloud lifting and clearing the summits by the afternoon with good views likely.

Visibility: Mainly very good visibility throughout the day.

Meteorologist's View

Northerly winds easing during the day. Freezing level falling to near surface by the end of the day so feeling very cold.

Forecast for Saturday 02 Jan 2021

Weather: A dry and bright day with good spells of sunshine, perhaps the odd wintry showers in the east.

Maximum wind: Northerly 10-15mph.

Chance of cloud free mountain/hill tops above 800m: 90% chance of cloud free tops

Visibility: Very good in general.

Temperature: **Valleys:** Minus 3 rising to plus 1 Celsius.
At 800m: Minus 3 Celsius
Freezing level: Around 200m.

Mountain Weather Forecast

Ground Conditions Supplement

Date: Wednesday 31 December 2020. Location: Hallsfell Top (Blencathra) at 12:05

Full report: A beautiful day in the fells with inversion conditions blanketing large areas of the region under low cloud and only the higher tops peeking through for most of the day. A dusting of new snow fell overnight down to low levels and terrain remains widely frozen from valley level upwards. Compacted snow on the paths and ice at all levels present real hazards, especially around drainage lines and stream crossings. The snow level remains at roughly 300m and increases a little with height to roughly boot-deep in areas where it hasn't been disturbed by the wind. Knee-deep drifts are not uncommon. High ground exposed to the wind tends to be relatively well scoured, although almost no bare ground is visible across the Blencathra tops. Some south-facing slopes have been affected by the sun in the last few days and have thinner and more patchy snow cover. Sharp edge is in full winter condition and great care is required on this, and any similar exposed routes from which a fall could be very serious and potentially fatal. Small cornices have formed on many different aspects, typically around corrie rims and along ridge flanks. These are comprised of soft unstable snow and should be given a wide berth. Some small upland tarns have frozen over and with snow on the top of the ice, they can be quite difficult to see and present an additional hazard. Temperature: minus 2.0 C, Maximum wind speed 13.8 mph, Wind chill: minus 9.4 C, Average wind speed: 12.0 mph
